

\$ etymologiae --about

Isidore of Seville ordered all knowledge into twenty books, derived every thing from its name, and invented half of the derivations. This edition repeats the gesture fourteen centuries on, with the errors inverted: the books reordered by emergence – mathematics first, the sacred demoted to Book XV, the talking machine last – and every etymology true, or honestly confessed disputed, or famously false and here debunked.

All 218 chapters are poems. Sonnets and heroic couplets, blank verse and ottava rima, a pantoum for the states of matter, a villanelle whose refrains are copies, terza rima for the earth's interior, haibun for the beasts. They were written by dispatched scribe-engines – Sonnet, Opus, and Haiku – under an editorial bench that audited every line-end, for a reader at home in both the terminal and the scriptorium.

Book Twenty, closing where all making stops:
a tool that speaks, and does not know it stops.
– the edition's last lines
